Dear GoML Hiring Team,

I am writing to apply for your Frontend Developer position. For over three years of freelance delivery I have built React and Next.js interfaces in TypeScript and modern JavaScript for production platforms with real users, and your posting's framing, shaping the visual layer of next-gen AI products, describes the work I already do.

What draws me to GoML specifically is the company itself: an AI systems implementation company and leading AWS Gen AI Partner that offers Claude Agent Development as a service, with 130+ AI systems implemented. Those systems reach users through their interfaces, and I already build with AI-assisted development workflows, using Claude Code for coding and debugging. Your remote-first setup with a Coimbatore office also matches my record: every client project since May 2023 has been delivered remotely from Mathura.

How I match your must-haves:

- React.js, JavaScript (ES6+), TypeScript in production: three freelance platforms shipped end to end, including Cashbackwallah's logistics flows (1,000+ orders processed) and Dream10's real-time quiz leaderboards.
- Responsive, reusable UI: Tailwind CSS and Material UI; order, payout, and dashboard screens built for real users on any device and browser.
- State and APIs: Zustand and TanStack Query for client and server state, RESTful API integration with caching and error handling, and JWT-based auth flows with Firebase OTP.
- Delivery: Git version control, CI/CD, production error monitoring with Sentry, and server-side rendering through Next.js.

For your first 60 days, I would build user-facing features and reusable components, integrate cleanly with your backend APIs, and ensure UI performance across browsers and devices, working directly with your design and backend teams. My portfolio at gauravmrjatt.vercel.app and GitHub show the production patterns you would get from day one.

I look forward to hearing from you.

Kind regards,

Gaurav Chaudhary
