Dear Heads Up For Tails Hiring Team,

I build MERN stack products end to end: React and TypeScript frontends, Node.js and Express.js backends, MongoDB and PostgreSQL schemas, and the CI/CD pipelines that keep them running in production, over three years of freelance delivery for Indian clients. I am writing to bring exactly that end-to-end ownership to your MERN Stack Software Engineer role.

Heads Up For Tails has grown from a single 2008 kiosk into India's first and most trusted pet care brand, with 100+ stores and 80+ pet spas across 20+ cities plus your Singapore storefront, and an active franchise program. A retail platform at that scale lives or dies on exactly what your posting asks for: schema design, proactive monitoring, and reliable order and payment flows, the same territory as the multi-level franchise commission and payout system I built for a live logistics platform. That is where I have spent the last three years, and why your Scale & Optimize bullet is the one I would take first.

How my experience maps to your requirements:

- MERN production delivery: a logistics platform on React/Next.js, Express.js, and PostgreSQL processing 1,000+ orders, plus a real-time quiz platform on Node.js with WebSockets.
- AI-augmented engineering: Claude Code is part of my daily development lifecycle for coding, automated testing, and faster debugging, the workflow your posting describes.
- Rigor and scale: Git workflows, GitHub Actions CI/CD, Docker, and monitoring with Prometheus, Grafana, Loki, and Sentry on live systems.
- Initiative: anti-cheat rules for the quiz platform and fraud detection still running on the lead-tracking platform.

Your bar is 3 to 4 years of MERN experience; mine is roughly two and a half years of continuous freelance production delivery, with platform maintenance ownership since 2024. MongoDB schema design is solid, Data Vault shipped on MongoDB with Mongoose, while aggregation-pipeline depth is an area I am actively deepening. My work so far has been solo, which is precisely why a collaborative squad with product managers and designers appeals to me: shared code reviews and technical decisions.

I am based in Mathura, open to your Gurugram office, and available immediately with no notice period. I would welcome the chance to discuss taking HUFT's customer-facing systems from schema through deployment.

Kind regards,

Gaurav Chaudhary
