Dear Jioskill Hiring Team,

I am writing to apply for your Frontend Developer position. I have spent over three years building React and Next.js interfaces in TypeScript and modern JavaScript for production platforms with real users, and I want to bring that to your EdTech platform full time.

On your platform, the interface is what learners actually touch: content-heavy pages, live activity, and every kind of device. JioSkill's stated mission, bridging the education-industry gap, is met or missed in that interface. That is the class of UI I have been shipping: responsive dashboards, real-time leaderboards, and multi-step flows that hold up in production. This role puts me on exactly the frontend problems I like most.

How I match what you are looking for:

- React, Next.js, TypeScript in production: two freelance platforms shipped end to end, including Cashbackwallah's logistics flows (1,000+ orders processed) and Dream10's real-time quiz leaderboards.
- Responsive, polished UIs: Tailwind CSS and Material UI as daily tools; KYC-gated order placement, wallet views, payout screens, and live dashboards built for real users.
- Performance under load: WebSocket-driven interfaces and Redis-backed data flows that stay responsive during high-concurrency events.
- Clean, maintainable delivery: Git workflows, CI/CD, and end-to-end ownership from components through deployment, iterating against client feedback as the work shipped.

I work directly with clients to turn requirements into shipped interfaces. My portfolio at gauravmrjatt.vercel.app and GitHub show the same production patterns you would get from day one.

On logistics: I can join immediately, and I am open to hybrid work in Bengaluru, relocating from Mathura.

I look forward to hearing from you.

Kind regards,

Gaurav Chaudhary
