Dear MongoDB Hiring Team,

I am applying for the Software Engineer 3, AI Builder Experience role on the AI Interfaces team, which builds the surfaces where agents talk to MongoDB. I build production Node.js and TypeScript services end to end and use Claude Code for coding, testing, and debugging, so this work sits directly in the path of how I already build software.

I have used MongoDB with Mongoose in Data Vault, a privacy-focused file manager with chunk-based encrypted storage and resumable uploads. What draws me to AI Builder Experience is the data-access layer at the point where agents, not just applications, become its clients, and the chance to contribute to the team behind the MongoDB MCP Server and Agent Skills.

How my experience maps to your expectations:

- Complex projects shipped end to end: built a production logistics platform from scratch (TypeScript, Express.js, Prisma, PostgreSQL) processing 1,000+ orders, from shipment booking to a multi-level franchise commission system.
- Scalable real-time services: live leaderboards and high-concurrency event handling with WebSockets, Redis, RabbitMQ, and Node.js Cluster on a production quiz platform.
- Production monitoring: Prometheus, Grafana, and Loki on the Lead Tracking System, an affiliate platform I built in 2024 and still maintain; ready to take part in a 24/7 on-call rotation.

I am based in Mathura and open to relocating for the hybrid schedule in Gurugram. My over three years of freelance ownership have covered ambiguous problems from scoping through deployment and iteration against live traffic. I have delivered solo to date and want the counterweight of a team, where shared code reviews and development practices sharpen the work.

I would welcome the chance to discuss how this experience would serve the AI Interfaces team. I look forward to hearing from you.

Kind regards,

Gaurav Chaudhary
