Dear Amadeus Hiring Team,

I am applying for the Junior Software Development Engineer role in Bengaluru. I am a freelance full-stack developer with over three years of production delivery in TypeScript, Node.js, and React, and I am open to relocating to Bengaluru. Amadeus runs large-scale software for the travel industry, and booking, payment, and fulfillment flows are what I have spent those three years building.

What I would bring to your engineering teams:

- Large-scale backend systems: I designed and built a logistics platform backend from scratch in Express.js, TypeScript, Prisma, and PostgreSQL: 145 REST endpoints, 23 database models, and 1,000+ orders processed, including a wallet and transaction ledger, automated payouts, and webhook processing.
- High-concurrency services: I built fault-tolerant Node.js services for a real-time quiz platform on Redis, RabbitMQ, and WebSockets, with live leaderboards, anti-cheat checks, and retry-safe payment and payout processing under load.
- Software engineering fundamentals: I am completing a B.Tech in Computer Science and Engineering (expected 2027) with coursework in data structures, algorithms, OOP, DBMS, operating systems, and computer networks, and hold a 1,430 LeetCode contest rating.
- End-to-end ownership: as a solo freelancer I take a feature from schema and API through UI, integrations, Docker deployment, CI/CD, and monitoring with Prometheus, Grafana, and Sentry.

Travel runs on the same primitives as that logistics platform: comparison and quoting, booking and fulfillment, payment ledgers, and event-driven processing under real traffic. The travel domain would be new to me; the engineering is not.

Freelance work means I own the schema, the API, the deployment, and the debugging when something breaks. On a team I would bring the same habits: smaller changes, tests on the risky paths, and metrics in place before traffic arrives.

I would welcome the chance to walk through the code behind any of these projects.

Kind regards,

Gaurav Chaudhary
