Dear Fractal Hiring Team,

I am applying for the Full Stack Developer position in Bengaluru. I have built and maintained production full-stack applications in Node.js, React, and TypeScript for over three years as a freelance developer, and the scope you describe, developing AWS Lex chatbot workflows, integrating backend services, and running DevOps and cloud operations, is the kind of end-to-end ownership I already hold for my clients. My recent work includes a real-time quiz platform on WebSockets, RabbitMQ, and Redis, and a lead-tracking platform with 107 REST endpoints and Prometheus and Grafana monitoring. Across these projects I owned architecture, integrations, deployment, and monitoring end to end.

What I would bring to your chatbot and cloud platform:

- Full-stack delivery: I built a logistics platform from scratch (Next.js 16, React, TypeScript, Express.js, Prisma, PostgreSQL) with 145 REST endpoints and 1,000+ orders processed, including a multi-level franchise commission system.
- Backend integration: I integrated Shiprocket, Razorpay (payment signature verification), Firebase OTP, Redis, and Sentry into production systems, with wallet and transaction ledgers, KYC-gated orders, automated payouts, webhook processing, and scheduled refunds.
- DevOps and cloud: I containerize services with Docker, deploy on AWS EC2 and Linux with NGINX, and manage CI/CD with GitHub Actions, with Prometheus, Grafana, Loki, and Sentry watching production. I hold an AWS Cloud Computing certification (JOVAC, 2025).
- Chatbot-adjacent work: I have built real-time, event-driven systems (WebSockets, RabbitMQ, Kafka, Redis pub/sub) and integrated the Telegram Bot API in Data Vault, so connecting conversational interfaces to backend services is familiar territory.
- Databases and testing: PostgreSQL, MongoDB, MySQL, and Redis in production, with Prisma and Mongoose, plus automated test suites (10-file suite on my lead-tracking platform).

To be direct about two gaps: I have not shipped production chatbots on AWS Lex yet, and my CI/CD pipelines run on GitHub Actions rather than Jenkins. My AWS exposure today is EC2 and cloud deployment, and I close tool gaps quickly on live systems because the underlying skills, REST API design, backend integration, Docker, and cloud operations, are already in daily use. I also work directly with clients and external service teams such as Shiprocket and Razorpay, iterating on feedback across distributed partners.

Fractal's focus on AI and analytics, and the chance to build chatbot solutions for global clients, is exactly the kind of work I want to grow into. I am based in Mathura, Uttar Pradesh, and will relocate to Bengaluru for this role. I would welcome the opportunity to discuss how my background in full-stack delivery, payments, and DevOps can best support your team.

Kind regards,

Gaurav Chaudhary
