Dear Hiring Manager,

I am applying for the Full Stack Engineer position in Bengaluru. The front half of this role, React, TypeScript, JavaScript, and Next.js frontend architecture, is my primary stack: for over three years as a freelance full-stack developer I have shipped production applications end-to-end, from schema and API design through rendering and state in the client to deployment and monitoring.

Your homepage states that Healthify and Berry Street are coming together to build an insurance-covered AI metabolic health platform, and your app is trusted by more than 40 million users. Features like Coach Ria and HealthifySnap sit on exactly the layer I work in: polished, responsive user experiences over dependable APIs and background processing. What I would bring to that stack:

- Frontend architecture and performance: production Next.js 16 and React 19 clients, including a TypeScript client over a 145-endpoint logistics platform that has processed 1,000+ orders, and live leaderboards updating over WebSockets in a quiz platform shipped to partners.
- APIs, background jobs, and caching: REST APIs of 145 and 107 endpoints, GraphQL subscriptions fed by Kafka and Redis pub/sub, a RabbitMQ payout queue so slow jobs never block requests, and Redis-cached hot reads.
- End-to-end ownership: Docker, GitHub Actions CI/CD, AWS EC2, and NGINX deployments I ran myself, with Prometheus, Grafana, Loki, and Sentry watching production, and an automated test suite maintained alongside ongoing changes.

To be plain about the must-have list: I do not have production Python, Django or FastAPI experience yet, and the backend I have run in production is Node.js in the same problem space, async services under high concurrency with RabbitMQ queues, Redis caching and system design decisions that port directly. I have not shipped LLM or AI-agent features into a product and have not used LangChain or LiteLLM; I do use AI-assisted development tools daily, so building alongside AI is familiar even though shipping intelligent workflows into a product is new for me. I have not worked from Figma handoffs on a product team; my frontend experience is building polished interfaces directly in Next.js, React, and Tailwind, in production and in national frontend competitions, so translating a design handoff into code is new to me even though building polished interfaces is not.

I am based in Mathura, Uttar Pradesh, and will relocate to Bengaluru for your HAL 3rd Stage office.

Kind regards,

Gaurav Chaudhary
