Dear Kulfi hiring team,

I'm applying for Software Engineer I in Product / Full-Stack. I build product features end to end across web, backend APIs, and data, and every platform I've shipped as a freelance developer was built, deployed, debugged, and maintained by me alone. That is the same bargain your posting describes: notice what is broken without waiting for someone else to notice it.

Kulfi's setup is the one I work well in. The app has already passed 500,000 downloads on Google Play, and your site promises new games every week, a promise a small team keeps only by shipping small, complete features fast and keeping them healthy. Three years of solo ownership across three production systems has meant exactly that: ship small features fast, then be the person who keeps them running in production. Where my experience maps onto what you will hand me:

- End to end: built cheapship from scratch at Cashbackwallah, a Next.js frontend over Express APIs and PostgreSQL with 145 endpoints and 23 Prisma data models; 1,000+ orders processed, with Razorpay payments, webhooks, and refund workflows handled through the edge cases.
- Tests and self-review: maintain instant-panel, in production since 2023: 107 endpoints, Redis-cached reads, a RabbitMQ payout queue so slow payouts never block requests, and a 10-file test suite I run and extend.
- Real-time surfaces: delivered live leaderboards and anti-cheat at Dream10, the same two-client synchronization your two-phone games across calls need; maintain Apollo GraphQL WebSocket subscriptions with Kafka on a school platform.
- Debugging across layers: Sentry, Prometheus/Grafana, and queue logs go into every system on day one, so when a feature behaves badly I can trace it from client through network to backend and data before concluding where the bug lives. In your Flutter client plus API plus data stack, I would wire the same tracing from day one.

One honest gap: I have not built in Flutter or Dart yet. What I own is both sides of the API contract, and the transfer between web client and backend APIs and data is direct. I also pick up frameworks by building with them: Next.js, Apollo GraphQL, and Docker all went from first use to shipped work inside project timelines. On AI tools, I use Claude Code and similar assistants to move faster while remaining responsible for every line, and I can explain that code in your practical interview.

I can work in person in Jayanagar, Bengaluru. I look forward to hearing from you.

Kind regards,

Gaurav Chaudhary
