Dear Nestack Hiring Team,

I am applying for the Node.JS Backend Developer position in Hyderabad. I have built and maintained production backend systems in Node.js and TypeScript for over three years as a freelance developer, and the scope you describe, translating business requirements into effective code and supporting deployment to production, matches how I already work.

What I would bring to your backend services:

- Node.js and async programming: I built a 145-endpoint Express.js/Prisma/PostgreSQL backend with wallet and transaction ledgers, webhook processing, automated payouts, and scheduled refund workflows. I understand the event loop, promises, async/await, and the quirks of asynchronous programming.
- Multiple database integration: I have integrated PostgreSQL, MySQL, MongoDB, and Redis into production systems. My logistics platform uses PostgreSQL with 23 Prisma models; my lead-tracking platform uses 12 models with Redis-cached hot reads.
- Authentication and authorization: I implemented JWT and Auth0-backed authentication with role-based access control, payment signature verification, KYC-gated order paths, and automated fraud detection across two production platforms.
- Code quality and testing: I maintain automated unit and integration test suites in production repositories. My open-source platforms (59,000 and 31,000 lines) are available for review on GitHub.
- Deployment and DevOps: I containerize services with Docker, run CI/CD with GitHub Actions, and deploy on AWS EC2 and Linux with NGINX. Production monitoring uses Prometheus, Grafana, Loki, and Sentry.

I am based in Mathura, Uttar Pradesh, and am open to relocating to Hyderabad. I look forward to hearing from you.

Kind regards,

Gaurav Chaudhary
