Dear Plane Hiring Team,

I am applying for the Software Engineer, Backend (Node.js) role at Plane. I have built and maintained production backend systems in Node.js and TypeScript for over three years as a freelance developer, and the scope you describe, owning integrations, queues, and OAuth APIs that keep work systems synchronized, is exactly the kind of server-side ownership I want to do next.

What I would bring to your backend services:

- Node.js and TypeScript in production: I designed and built a 145-endpoint Express.js/Prisma/PostgreSQL backend (23 models, 1,000+ orders processed) with wallet and transaction ledgers, webhook processing, automated payouts, and scheduled refund workflows. Open source at github.com/Gauravmrjatt/cheapship (about 59,000 lines).
- Queue and worker systems: I built a RabbitMQ payout queue with retry-safe consumers and idempotent job processing, so slow payouts never block requests. I have also worked with Redis pub/sub, Node.js Cluster, and fault-tolerant async services for high-concurrency events.
- Third-party API integration: I integrated Shiprocket, Razorpay, and Firebase OTP into one system, handling rate limits, pagination, webhook delivery, and tokens that expire at the worst moment. Reconciling state after partial failures is work I do regularly.
- OAuth and authentication: I implemented JWT and Auth0-backed authentication with role-based access control, payment signature verification, and KYC-gated flows on one production platform. I have not yet worked on the provider side of OAuth.
- Postgres depth: My primary database is PostgreSQL with Prisma. I can read a query, add an index, and explain why it helped. The logistics platform runs 23 Prisma models with Redis-cached hot reads.

I have not built an importer or migration tool yet, and I have not worked on the provider side of OAuth or a developer platform other people built apps against. I close gaps like these quickly on live systems, and I am eager to learn.

I am drawn to Plane because you build in the open. Two of my production platforms are open source on GitHub (59,000 and 31,000 lines), and I am comfortable with public GitHub issues as a support channel.

Kind regards,

Gaurav Chaudhary
