Dear Seismic Hiring Team,

I am applying for the Software Engineer I (Backend, AI Interfaces) role at Seismic in Hyderabad. I have built and maintained production backend systems in Node.js and TypeScript for over three years as a freelance developer, and backend services with cloud deployment are exactly the server-side ownership I have delivered for clients. I am open to relocating to Hyderabad.

What I would bring to your backend services:

- Node.js and TypeScript in production: I designed and built a 145-endpoint Express.js/Prisma/PostgreSQL backend (23 models, 1,000+ orders processed) with wallet and transaction ledgers, webhook processing, automated payouts, and scheduled refund workflows. The codebase is open source at github.com/Gauravmrjatt/cheapship (about 59,000 lines).
- Queue and worker systems: I built a RabbitMQ payout queue with retry-safe consumers and idempotent job processing, so slow downstream calls never block requests. I have also worked with Redis pub/sub, Node.js Cluster, and fault-tolerant async services for high-concurrency events.
- Cloud and DevOps: I containerize services with Docker, run CI/CD with GitHub Actions, and host on AWS EC2 and Linux with NGINX. I also set up observability with Prometheus, Grafana, Loki, and Sentry on production systems.
- Databases and query work: My primary database is PostgreSQL with Prisma (23 and 12 model schemas), with indexes and Redis-cached hot reads.

One area I want to be direct about: my hands-on experience with AI and machine-learning systems is still early, and I have not shipped model-backed features in production. What I do have is the backend side of that work - clean API boundaries, reliable async pipelines, and state management - and I close gaps like these quickly on live systems.

I am drawn to Seismic because you build an AI-powered platform that real sales teams depend on, so the backend must be correct, observable, and fast under load. That is the standard I already hold my own systems to.

Kind regards,

Gaurav Chaudhary
